# Part A

## Database Design (Table Specifications)

### Actors Table

Attribute	Datatype	Constraint	Default	Description
actor_id	NUMBER(9)	PK, pk_actor_id		Unique ID of the actor
a_name	VARCHAR2(30)	CHECK, upper_a_name NOT NULL		First name
a_surname	VARCHAR2(35)	CHECK, upper_a_surname NOT NULL		Last name
a_gender	CHAR(1)	CHECK, check_a_gender		Actor's Gender (Male, Female, Other)
a_email	VARCHAR2(50)	CHECK, upper_a_email UNIQUE, unique_a_email NOT NULL		E-mail address
a_address	VARCHAR2(30)	CHECK, upper_a_address	NULL	Actor's address
a_city	VARCHAR2(30)	CHECK, upper_a_city	NULL	Actor's city
a_country	VARCHAR2(30)	CHECK, upper_a_country	NULL	Actor's country
a_birthdate	DATE	TRIGGER, check_actor_age_trigger	NULL	Date of birth
a_contact_num	VARCHAR2(30)	UNIQUE, unique_a_contact_num NOT NULL		Contact number

### Series Table

Attribute	Datatype	Constraint	Default	Description
series_id	NUMBER(8)	PK, pk_series_id		Unique ID of the series
title	VARCHAR2(50)	CHECK , upper_title NOT NULL		Series name
description	VARCHAR2(400)	CHECK , upper_description	NULL	Short synopsis
production_year	DATE	CHECK, check_production_year	NULL	Production year
num_of_seasons	NUMBER(2)			Number of Seasons
genre	VARCHAR2(30)	CHECK, upper_genre	NULL	Type of series

### Episodes Table

Attribute	Datatype	Constraint	Default	Description
episode_id	NUMBER(9)	PK, pk_episode_id		Unique ID of the episode
title	VARCHAR2(50)	CHECK, upper_episode_title NOT NULL		Episode name
season_num	NUMBER(2)		NULL	Number of seasons
episode_num	NUMBER(5)			Episode number in the season
duration	NUMBER(5)		NULL	Length of episode in seconds
summary	VARCHAR2(400)	CHECK , upper_summary		Short summary

### Viewers Table

Attribute	Datatype	Constraint	Default	Description
viewer_id	NUMBER(10)	PK, pk_viewer_id		Unique ID of the viewer
v_name	VARCHAR2(30)	CHECK, upper_v_name NOT NULL		First name
v_surname	VARCHAR2(35)	CHECK, upper_v_surname NOT NULL		Last name
v_gender	CHAR(1)	CHECK, check_v_gender	NULL	Viewer's gender (Male, Female, Other)
v_email	VARCHAR2(50)	CHECK, upper_v_email UNIQUE, unique_v_email NOT NULL		E-mail address
v_address	VARCHAR2(30)	CHECK, upper_v_address	NULL	Viewer's address
v_city	VARCHAR2(30)	CHECK, upper_v_city	NULL	Viewer's city
v_country	VARCHAR2(30)	CHECK, upper_v_country	NULL	Viewer's country
v_birthdate	DATE	TRIGGER, check_viewer_age_trigger	NULL	Date of birth
v_contact_num	VARCHAR2(30)	UNIQUE, unique_v_contact_num NOT NULL		Contact number

### Casting Table

Attribute	Datatype	Constraint	Default	Description
casting_id	NUMBER(9)	PK, pk_casting_id		Unique Casting ID
actor_id	NUMBER(9)	FK, fk_actor_id		Unique ID of the actor
series_id	NUMBER(9)	FK, fk_series_id		Unique Series ID
c_role	VARCHAR2(30)	CHECK, upper_c_role		Role of the actor

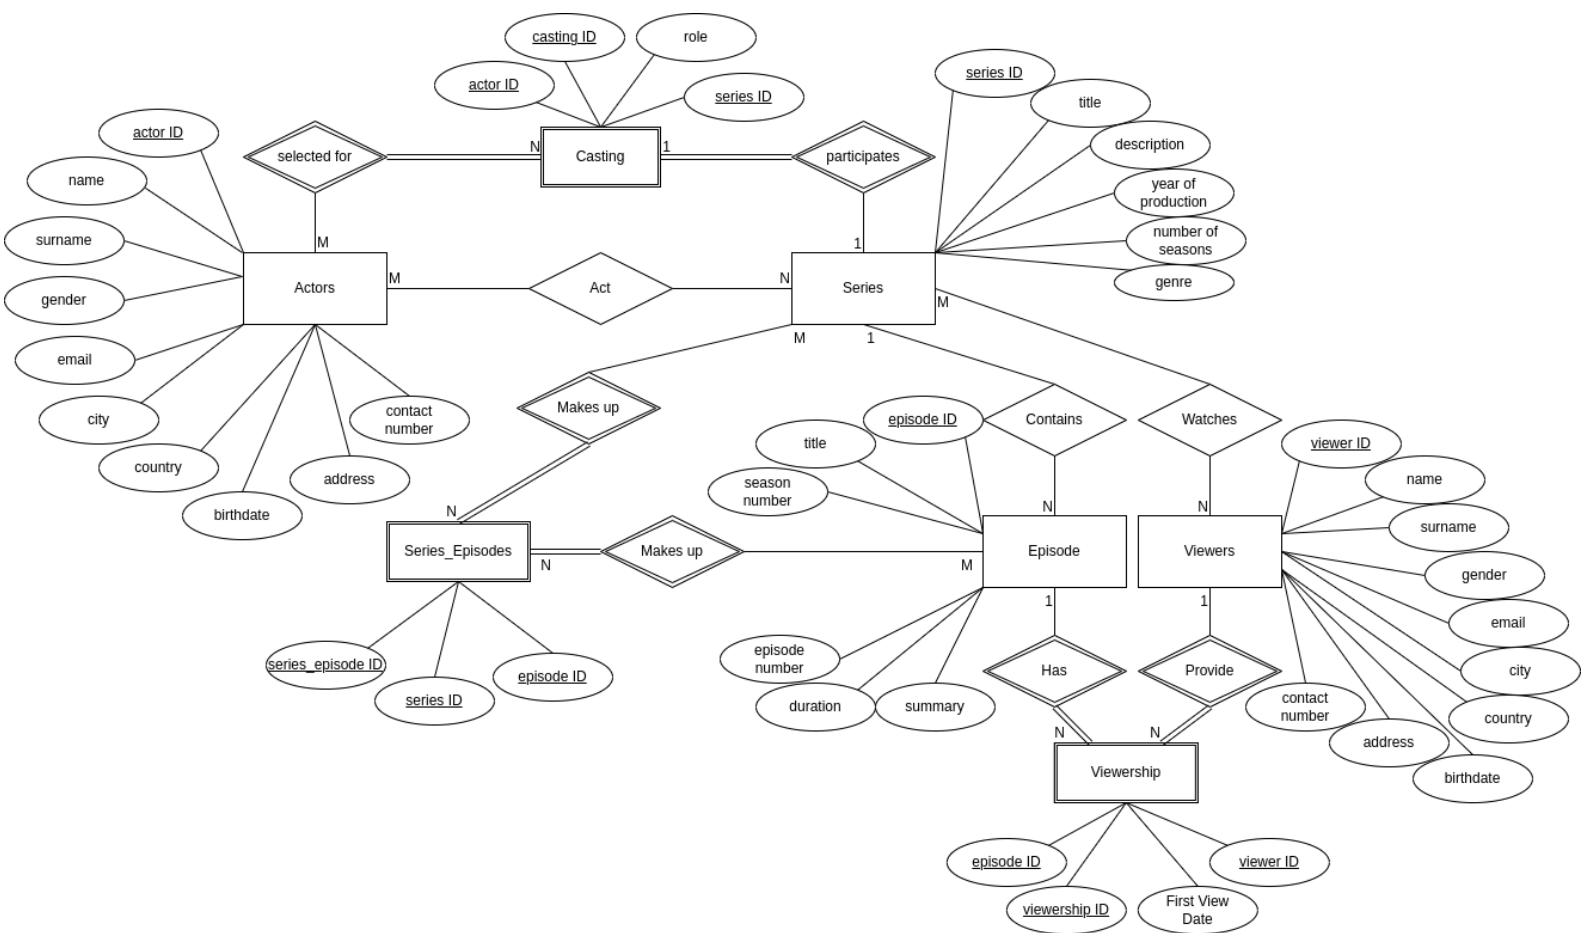

### Viewership Table

Attribute	Datatype	Constraint	Default	Description
viewership_id	NUMBER(10)	PK, pk_viewership_id		Unique Viewership ID
episode_id	NUMBER(9)	FK, fk_episode_id		Unique ID of the actor
viewer_id	NUMBER(9)	FK, fk_viewer_id		Unique ID of the viewer
first_view_date	DATE	TRIGGER, check_first_view_trigger		Date that the viewer watched the episode for the first time

### Series\_Episodes Table

Attribute	Datatype	Constraint	Default	Description
series_episode_id	NUMBER(10)	PK, pk_series_episode_id		Unique ID of the series_episodes
series_id	NUMBER(8)	FK, fk_series_id_series_episode		Unique ID of the series
episode_id	NUMBER(9)	FK, fk_episode_id_series_episode		Unique ID of the episode

# Part B

1. Could a star or snowflake schema be used for the database you created in Part A? What changes should you introduce? Provide an implementation.

## Star Schema Implementation

A star schema would require a central fact table and several dimension tables.

- Fact Table: The Viewership table could be used as the central fact table, as it records the key measurable event (viewers watching episodes).
- Dimension Tables: The other tables (Series, Episodes and Viewers) would act as dimension tables.

Changes Needed:

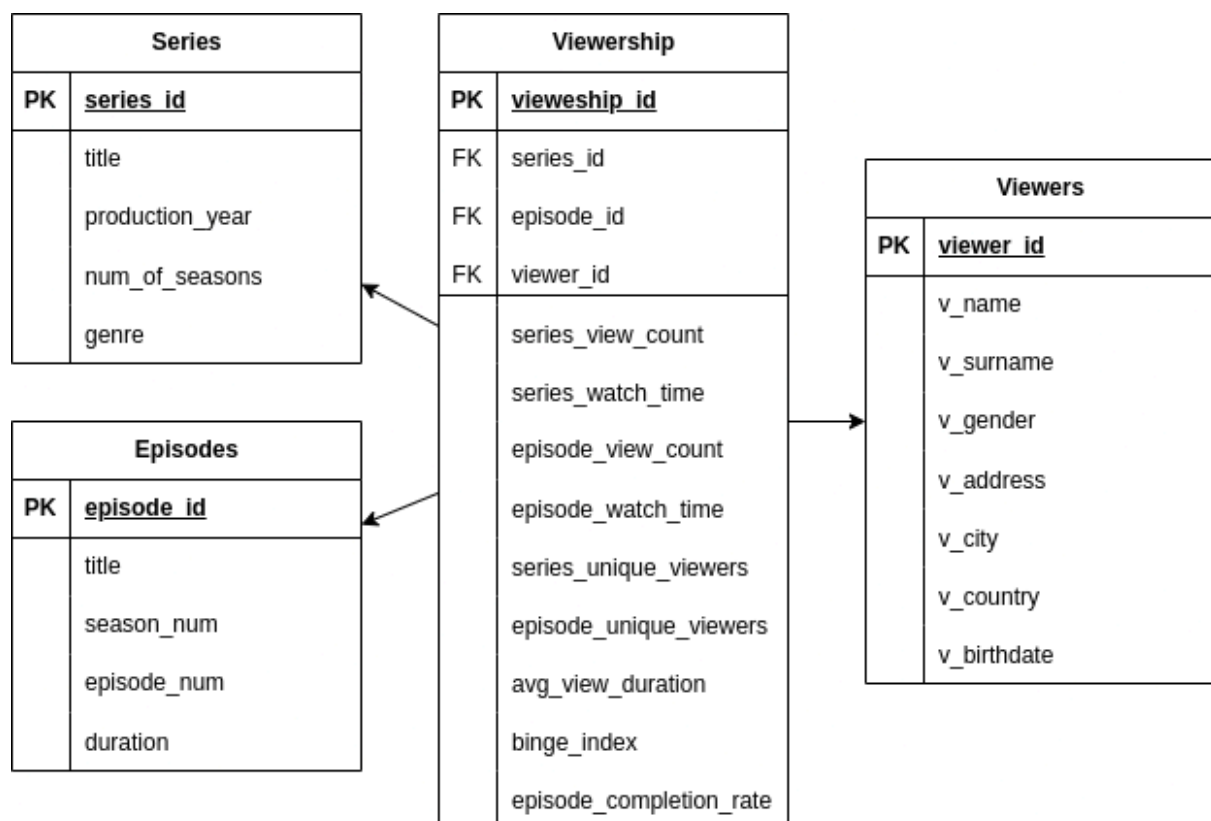

- Modify Viewership Table: Include foreign keys to dimension tables and measurable metrics.
- Remove Actors Table: It doesn't contribute to the calculation of key measures and metrics included in the Fact Table.
- Simplify Dimension Tables: Remove redundant attributes and ensure they provide descriptive information about the facts.
- In star schema, Dimension tables are not connected to each other directly. Therefore, the Casting table can not exist since it is made up from foreign keys of other tables.
- Fact Table - Viewership:
  - Primary Key: ViewershipID
  - Foreign Keys: ActorID (references Actors), SeriesID (references Series), ViewerID (references Viewers), EpisodeID (references Episodes)
  - Metrics:
    - Series View Count: The number of times a series is viewed by all viewers.
    - Series Watch Time: Total time spent watching a series by all viewers.
    - Episode View Count: The number of times an episode is viewed by all viewers.
    - Episode Watch Time: Total time spent watching an episode by all viewers.
    - Series Unique Viewers: The number of unique viewers that have watched a particular series.
    - Episode Unique Viewers: The number of unique viewers that have watched a particular episode.
    - Average View Duration: The average amount of time spent watching an episode in a single session.

- **Binge Index:** A measure of how many episodes of the same series are watched in one sitting.
- **Episode Completion Rate:** Percentage of an episode watched on average (100% would mean the entire episode was watched).

Metrics that could be included if certain attributes were available:

- **Peak View Time:** The most common time of day or day of the week an episode is watched.
- **Dimension Tables:**
  - **Series:** SeriesID (PK), Title, Production Year, Number of Seasons, etc.
  - **Episodes:** EpisodeID (PK), Title, Season Number, SeriesID (FK), Duration, etc.
  - **Viewers:** ViewerID (PK), Name, Surname, Gender, etc.

In the star schema, each dimension table is directly linked to the fact table. The dimension tables are denormalized, meaning they might contain redundant data.

## Snowflake Schema Implementation

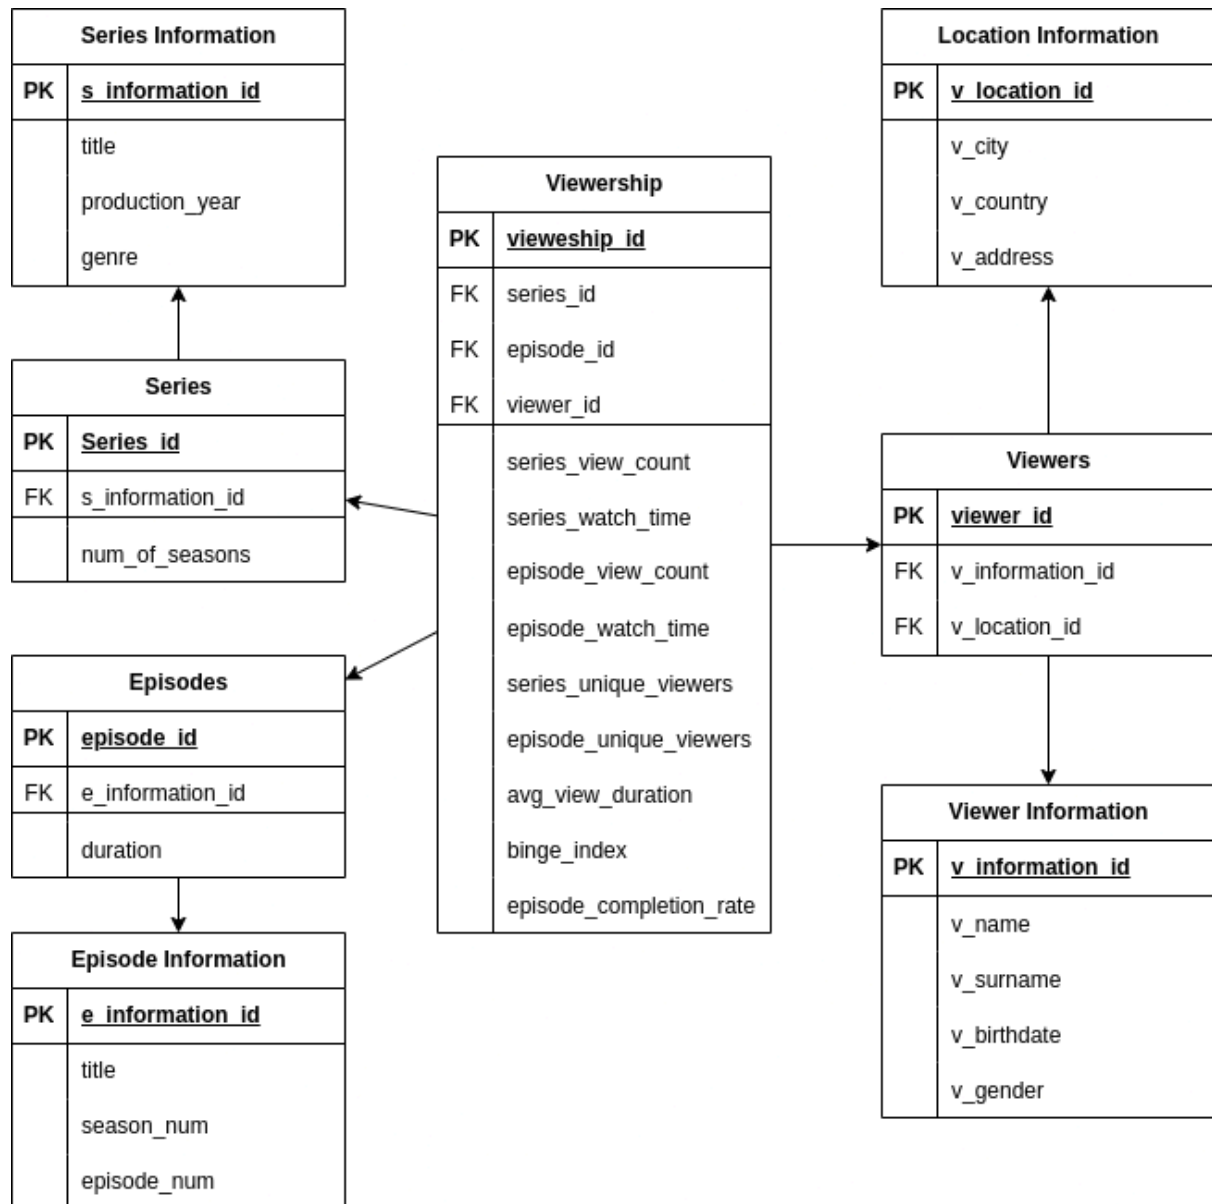

The snowflake schema is a more normalized version of the star schema. It would involve further decomposing the dimension tables.

Changes Needed:

- Similar to the star schema, but with additional steps to normalize the dimension tables.
  - For instance the Viewers table could be divided into three separate tables.
    - The main one consists of each viewer's unique ID number and two foreign keys of the following normalized tables:
      - Viewer Information: each viewer's personal details and
      - Location Information: pertaining to their origin (country, city, address).
  - Additionally, the Series table could be split into two tables. The main table consists of the unique ID, foreign key and number of seasons. The normalized table, called Series Information, contains the series title, production year and genre.
  - Finally, the Episode table could be divided into two tables. The unique ID, foreign key, and duration are the only columns in the primary table. The title of the episode, season number, and episode number are listed in the normalized table named Episode Information.
- 
- Fact Table - Viewership: Same as in the star schema.
  - Dimension Tables:
    - Series: SeriesID (PK), SeriesInformationID (FK), NumberOfSeasons
    - Episodes: EpisodeID (PK), EpisodeInformationID (FK), Duration, EpisodeNumber
    - Viewers: ViewerID (PK), ViewerInformationID (FK), ViewerLocationID (FK)
  - Additional Normalized Tables:
    - Series Information: SeriesInformationID (PK), Title, ProductionYear
    - Episode Information: EpisodeInformationID (PK), Title, SeasonNumber, EpisodeNumber
    - Viewer Information: ViewerInformationID (PK), ViewerName, ViewerSurname, ViewerGender
    - Location Information: ViewerLocationID (PK), Address, City, Country

In the above implementation of the snowflake schema the inclusion of the necessary attributes further reduces redundancy and improves computational efficiency. At the same time this can lead into more complex queries when trying to retrieve more specific information, due to the increased number of joins.

## Term Frequency - Inverse Document Frequency

2. Using a simple definition of Term Frequency (TF) as the number of occurrences of the term in a document, give the TF-IDF scores for the 10 most frequent terms in the following set of 2 documents:

A) "A star schema model can be depicted as a simple star: a central table contains fact data and multiple tables radiate out from it, connected by the primary and foreign keys of the database. In a star schema implementation, Warehouse Builder stores the dimension data in a single table or view for all the dimension levels. For example, if you implement the Product dimension using a star schema, Warehouse Builder uses a single table to implement all the levels in the dimension, as shown in the screenshot. The attributes in all the levels are mapped to different columns in a single table called PRODUCT".

B) "The snowflake schema represents a dimensional model which is also composed of a central fact table and a set of constituent dimension tables which are further normalized into subdimension tables. In a snowflake schema implementation, Warehouse Builder uses more than one table or view to store the dimension data. Separate database tables or views store data pertaining to each level in the dimension. The screenshot displays the snowflake implementation of the Product dimension. Each level in the dimension is mapped to a different table".

Very common words (called stop words) such as "a", "an", "the", "it" etc. are eliminated

## TF x IDF Calculation

$$w_{ik} = tf_{ik} * \log(N / n_k)$$

$T_k$  = term  $k$  in document  $D_i$

$tf_{ik}$  = frequency of term  $T_k$  in document  $D_i$

$idf_k$  = inverse document frequency of term  $T_k$  in  $C$

$N$  = total number of documents in the collection  $C$

$n_k$  = the number of documents in  $C$  that contain  $T_k$

$$idf_k = \log\left(\frac{N}{n_k}\right)$$

$T_k \setminus D_i$	Document A	Document B	TF (raw count)	IDF $\log(N/n_k)$	TF*IDF
table	5	6	11	0	0
dimension	4	7	11	0	0
schema	3	2	5	0	0
levels	3	2	5	0	0
implement	3	2	5	0	0
data	2	2	4	0	0
star	4	0	4	0.301	1.204
warehouse	2	1	3	0	0
builder	2	1	3	0	0
single	3	0	3	0.301	0.903
snowflake	0	3	3	0.301	0.903
all	3	0	3	0.301	0.903
product	2	1	3	0	0
view	1	2	3	0	0
store	1	2	3	0	0

$N = 2$ , because our corpus contains 2 documents in total

Similar words that counted as 1:

Table = [table, tables]

Dimension = [dimension, dimensional, subdimension]

Implement = [implement, implementation]

Level = [level, levels]

View = [view, views]

Store = [store, stores]
